

# Employee Tracker

---

An app to help you organize your business

## The Assignment

This project was a homework assignment for UW Full Stack Bootcamp. The instructions were to create a CL application using Inquirer, MySQL and console.table to print information from the database to the terminal. The application should allow the user to view, insert, update or delete data from a database containing information about their business's departments, employees, and employee roles.

User story:

As a business owner, I want to be able to view and manage the departments, roles, and employees in my company so that I can organize and plan my business.
